URGENT GLOBAL RESOURCES ALERT

Think Canada Is the U.S.'s #1 Ally? Think Again…

BACKSTABBED!

Right now, booming, oil-hungry China's making deals that will cut U.S. crude supplies off at the knees - contracting for billions of barrels of oil from the *same sources* Uncle Sam's counting on as alternatives to the Middle East...

Including a mammoth hidden oil reserve that's right next door - IN "FRIENDLY" CANADA.

And on or about March 15, 2005, a contract will be signed between China and Canada that'll *change America's oil outlook forever*. Get in NOW, and you'll be able to afford the $5-a-gallon gas that's coming - along with a Benz or two to burn it in...

The Canadian government is selling the United States' oil future down the river. But while most commodities investors will be bailing out of their energy positions, *you can cash in* - by buying grossly undervalued stock in the ready-to-explode resource giants that *99% of American investors overlook*.

A lucky few are already 'mining' these under-the-radar stocks for gains of 151%, 174%, 249% - even *270% or more*. Over the long haul, *the sky's the limit* for these new commodities players. Profits of over 3,000% would not be unrealistic.

To GET RICH as the United States *runs dry of oil*, read this report...

INSIDE: Your FREE 6-Volume *Orient Express - to Profit* Library

> ***"Canada should be a major beneficiary of Asian oil demand, especially in China, which has already been scouting in western Canada to secure access to oil reserves."***
>
> -The International Bank Credit Analyst

Up on the Hill, everyone's buzzing about...

The Great Canadian Double Cross

Believe it or not, the world's largest oil reserves aren't in Saudi Arabia, Syria, Iran or Iraq - but in traditionally America-friendly Canada...

But rather than being piped into the United States, this huge supply of crude will likely be *pumped onto tankers bound for the Orient*.

And in MERE DAYS, you'll be able to start cashing in on this deal - *if you know how...*

Dear Reader,

Fact: The world's largest reserve of crude oil lies not 7,000 miles away in the America-hating Middle East, but only a few hundred miles north of the U.S. border.

It's called the Athabasca oil sands, and it's located deep in the wilderness of Alberta, Canada. It isn't an oil field in the traditional sense (an underground wellspring of liquid crude) - but a *vast expanse of oil-soaked sands and clays* on the banks of several of that province's rivers...

And contained in those hundreds of square miles of black muck is more than 300 billion barrels of crude oil. That's more than in *all of Saudi Arabia*. More than in Iraq, Iran and Libya combined. It's enough oil to render the United States *completely independent* of Middle East supplies...

Until recently, however, extracting the oil from the sands has proven too costly to be feasible. But now that crude's hovering around 50 bucks a barrel or more, extraction has become worthwhile in a big way. Plus, some new developments in technology have brought these costs down to manageable (and even profitable) levels. That means that soon a river of oil - millions of barrels a day - will begin flowing out of Canada.

But as outrageous and ungrateful as it must seem to the American government, much of this oil likely *won't flow into the United States*...

Now that the Athabasca sands have become viable, Canada's beginning to flex its international oil muscles in a big way. And lately, it's forged an alliance with the United States' only economic and industrial rival on Earth:

China.

Hear That Giant Sucking Sound? That's the Sound of U.S. Oil Supplies Being *Siphoned Away by the Chinese*

Right now, many in Washington, D.C. are no doubt wringing their hands with worry over the Canada/China oil alliance. I can just see them now up there on Capitol Hill, pacing around with dazed looks on their faces, shaking their heads and grumbling to each other:

> *"Those backstabbing Canucks do nothing but leach off our economy - like the way they undercut us on prescription drugs. They owe us that oil!"*
>
> *"They spend next to nothing on defense because of their lucky proximity to our awesome military might - they don't even have an army, do they? And now they're going to sell us out?!?"*
>
> *"How can they sell oil to China and not us? Doesn't NAFTA have some fine print preventing that kind of thing?"*
>
> *"Without our protection, Canada's the natural resources equivalent of Fort Knox guarded by a 'No Trespassing' sign and a Chihuahua. Can't we just take the oil? You said they don't have an army..."*

Instead of counting on Canada to blindly pander to American needs, Congress and the president are finding that they need to offer more than just armed protection to our northern neighbor to ensure preferential treatment. If you're skeptical about whether China and Canada really are gravitating toward each other economically (and leaving the United States out in the cold), consider this: Canadian exports to China jumped *55% in just the first 10 months of 2004...*

Because the U.S. government has always taken Canada's support for granted, it's ignored these kinds of warning signs while Canada and China have cozied up to each other - in anticipation of the day when crude prices would reach levels that would make wringing the oil out of the Athabasca sands a worthwhile proposition.

Now, that day has come...

March 15, 2005:
Day of Reckoning for U.S. Oil Supplies

On Jan. 20, 2005, the 13 agreements of the Statement on Energy Cooperation in the 21st Century were signed in Beijing by Canadian Prime Minister Paul Martin and Chinese Premier Wen Jiabao. Pledging cooperation in energy (both oil and gas), minerals and other sectors, the agreements represent a culmination of a 10-year trend of resources and import/export cooperation between the two nations.

Under the authority of the new Canada-China Joint Working Group on Energy Cooperation:

- China's two biggest oil companies, PetroChina and Sinopec (both state owned, by the way), will contract to purchase oil from the Athabasca sands - which could top *2 million barrels a day* once production ramps up

- One of these same two companies has negotiated to acquire a *controlling interest* in a Calgary-based Canadian energy company that is successfully developing a pair of oil sand sites

- China Minmetals Inc. (yep, state run) has aggressively negotiated to *buy outright* Toronto-based resources and mining giant Noranda

- More than *100 individual trading agreements* have been inked between Canadian companies and Chinese companies - not only in oil, but also in energy, resources, technology and agriculture

By themselves, these 13 signed agreements point unmistakably toward a huge Chinese-Canadian energy and resources alliance that will *change the United States' oil outlook forever*. But here's the real smoking gun:

These agreements laid the framework for a new, 720-mile Canadian oil pipeline from northern Alberta west to the British Columbia coast. Its sole purpose is to service Chinese oil demands from the Athabasca sands. Once operational, this pipeline will be able to transport 400,000 barrels of oil per day - and *as much as 80% of this crude* will be earmarked for China-bound tankers.

Canadian energy giant Enbridge Inc. has offered state-owned Chinese interests a *49% ownership stake* in the massive pipeline...

And the contract is expected to be signed on or about March 15, 2005.

This isn't just idle speculation by the media or government mouthpieces - it's a bona-fide pending deal reported by several international news organizations and confirmed by Enbridge's official spokesperson. If you haven't read about this contract yet, *you will in the next few days*, I promise it...

CANADA: BUILDING CHINA FROM THE GROUND UP?

It isn't just oil Canada will be exporting to China, either. Their new alliance includes provisions for aggressive exportation of natural gas and other energy-related commodities - including uranium for the *27 new nuclear power plants* China is planning

Once the ink dries on this deal, its implications will ripple through the energy and resource commodities investing world - flattening many mainstream-recommended energy stocks while catapulting a handful of other, lesser-known securities into the profit stratosphere.

No, this deal won't cause an obvious-to-all 'domino effect' in the entire stocks world the way some events might (like wars and disasters), but there will definitely be both an *immediate profit spike* and a *long-term money-making trend* for certain companies and industries. For those in the know and properly positioned to capitalize on the upcoming China/Canada relationship, it'll be grand - with **profits of thousands of percent likely** *without undue risk*...

YOU could be one of them, if you get in now.

The savvy subscribers we've recently alerted to these stocks are already seeing gains of **174%**, **249%** and even as much as **270%** - and remember, this is *before* the upcoming China-fueled boom. To ride this wave to its logical, hyper-profitable end (I'm talking about potential gains of *3,000% or more*), you need to get in on it *today*, before the deal's on everyone's "radar."

Of course, I'm going to help you do that, **FREE,** in just a minute.

If you think these opportunities would be hard to ferret out on your own, *you're right*. Not everyone with a stockbroker or E*TRADE trade account will be putting money into these energy giants of tomorrow. They're just *not that obvious* to the mainstream's flag-waving conventional investment wisdom...

But they are <u>sound, well-positioned companies</u> that'll surely not only protect your portfolio from the shock waves this imminent Canadian 'betrayal' of U.S. crude interests will send through the oil investment sector, but also leave you *sitting pretty with over 30 times your money* if all goes as it's poised to...

When that happens, how much will $5-a-gallon gas really affect you?

Besides Simply Watching It Happen, There's Only One Thing You Can Do About This Seismic Realignment in the World Oil and Resource Commodities Pecking Order: *Profit Obscenely*

But you'll only cash in if you know *exactly where to put your money*. And it's going to be tricky to make good picks in this investment environment. That's why the majority of mainstream analysts are going to try to play it super-safe, recommending investment in bloated, household-name energy stocks - companies that are so large they can find ways to survive (they hope) no matter what happens in the world oil market.

Stocks like *Halliburton*, *ExxonMobil*, *ConocoPhillips* and the like. Big, flag-waving American energy companies that feel good to invest in for *all the wrong reasons* - reasons like political fervor or nationalist pride.

There's a good chance these kinds of stocks will *completely flat-line for years* (or worse yet, steadily lose money). But the mainstream's investment "gurus" will no doubt call this a victory - because millions of *other* American investors will have poured millions directly into smaller, newer stocks they *think* will ride the boom - including hundreds of fledgling Chinese IPOs...

And most of *them* will *lose everything*.

That's why the mainstream money "talking heads" will be so conservative - they'll see all the uncertainty ahead and see only one way to play it: Feel-goody and patriotic. But since all they ever look at are large-caps, they won't know what *the real profit plays are* in this soon-to-be-upended energy sector...

But if you act now, before the impending "Ides of March" pipeline deal between China and Canada (yes, the one that's going to cripple U.S. oil supplies, you shameless profiteer), you could make **double**, **triple**, **quintuple**, even **30 times your money or more** on the cherry-picked, under-the-radar energy and services stocks I'm about to reveal to you.

In other words: You could get filthy rich - *starting today and in a very short amount of time*, comparatively speaking.

I ask you: *What could be more American than that?* Now here's how to DO IT...

There's *Tons of Money to Be Made* On This Inevitable Shift in the Balance of World Economic Power, if You're in the Know

I'm talking about short- and medium-term gains of **174%**, 249% **and** even ***270%*** (remember - a few savvy subscribers are already doing it). These profits aren't high risk or super volatile, either. There's amazing potential for both short-term and long-term gains without a bunch of trading or market watching. And over the long term, the outlook's even rosier - profits in the **3,000%** range aren't unlikely...

How do I know?

Because I've been uncovering these kinds of outrageously profitable commodities investment opportunities for more than a decade. And over that same span of time, I've helped a great number of people *just like you* to make millions with these crisis-borne money-makers. Allow me to introduce myself:

My name's Addison Wiggin, and aside from being co-author of the *New York Times* best-selling book ***Financial Reckoning Day*,** I'm a 10-year veteran of small-cap and lesser-known resource stock and commodities analysis...

I'm also the publisher of ***Outstanding Investments*,** a monthly advisory for savvy investors in the natural resource and commodities sectors. For years, we've been ahead of the curve in commodities investments. For instance, we predicted the resources instability that rising tensions in the Middle East would breed long before the fall of Saddam - or the Twin Towers...

In a Special Report to our readers on how to protect themselves from the Middle East crisis, we shined a light on a few 'safe haven' stocks that have soared in value **174%**, **249% and** even as much as **270%**. Here are just a few of the opportunities we spotted before the crowd (truth be told, most of these have *never* been on the mainstream's radar):

Cameco..Up 116%
Key West Energy..Up 137%
Tocqueville Gold...Up 151%
PetroChina (yep, we picked them).................... Up 174%
Niko Resources...Up 235%

Coeur d-Alene Mines..Up 249%

These are just a handful of the amazingly profitable opportunities ***Outstanding Investments*** readers have discovered in response to the current resources crisis caused by the Middle East quagmire. And as you've just learned, there's a new, even bigger commodities crisis brewing between China and the United States...

As always, ***Outstanding Investments*** is ready for it - and so are our readers. You can be, too, if you sign up for my one-of-a-kind advisory **RISK FREE** today. Right now, I've got 10 prime, yet little-known stock markets plays that'll help you not only weather the coming China/U.S. oil struggle, but very likely profit obscenely from it as well. And in just one minute, I'm going to show you how to discover all of them, plus your **FREE 6-volume library** of in-depth special e-reports I've put together especially to help my readers weather the upcoming China-driven commodities whirlwind - and come out golden on the other side. You'll also find new, lucrative picks every month once you subscribe to my award-winning ***Outstanding Investments*** advisory service.

Want an example of one of these plays? Here's a great one: *shipping companies*.

Once the New China/Canada Oil Deal Starts Seriously Producing (and that day will be soon), *Your Profit Ship Will Come In* - as Far East Demand For Tankers Will Absolutely Explode

I've been around the commodities investment world long enough to know that with every crisis comes *opportunity*. There's always a way to play the winds of free-market capitalism and global development for exquisite profits - regardless of what it may mean for any one nation or industry. There are two keys to doing this right every time, and I'll tell you exactly what they are in a few minutes...

But I digress. Right now, I want to whisper in your ear about an incredible opportunity that's poised to *sail off into the profit sunset* along with the upcoming China Boom: Ocean-going tanker companies.

You have to invest very carefully, though, because not every shipping company will reap the profits. In fact, only a select few will. But oh, how those lucky few will soar into the profit stratosphere - likely paying back those who get in right now many times their investment back again. Here's why:

Canals and shipping hubs along many of the world's major oil routes have just enacted some new rules which dictate that *only certain types of tankers* can ship to the most desirable and profitable oil ports...

And the vast majority of the world's shipping companies *don't have the right kind of tankers* to capitalize on the upcoming China/Canada oil agreements - or any of the 48 other oil deals China's inked with nations around the world (more on these in a bit).

> ***"China has the capacity, the willpower, the structure, and the command economyto rip the heart out of manufacturing growth in Europe and America..."***
>
> -Irish Independent, Sept. 23, 2003

They can't just run out and buy a bunch of these big double-hulled boats, either. From the initial order to the bottle broken across the bow, it takes *four or five years* to build one of these vessels - and the major shipbuilders are already booked years in advance. That's why the few companies who are already properly equipped to service the coming China resource boom will be flying (or floating?) high in short order...

And you guessed it: I've picked a pair of these companies to recommend to you as part of your ***Orient Express - to Profit*** library - ones that already have a fleet of the *newest class of these state-of-the-art tankers* to ship oil safely around the globe. It's yours **FREE** when you sign up for the only resource investment advisory sure to keep you abreast of this new oil and commodities crisis: ***Outstanding Investments*.**

Already, one of these stocks has jumped 63% in <u>only nine months</u>. It's poised to go through the roof any minute now...

The other (a close competitor) has spiked *over 5% in just two months*!

You'll discover both of these stocks in your **FREE** Special e-Report entitled ***Two If by Sea: Shipping Stocks That'll Sail on The China Boom.*** More about this in a minute...

Like I said before, to capitalize on China's rise, you have to know where to invest, and in what industries (they're not all energy companies, as my shipping example shows). In a minute, I'm going to show you *exactly how to find out* - in your **FREE** six-volume ***Orient Express - to Profit*** library.

But first, I want to tell you *why* the 10 under-the-radar 'crisis' stocks

I'm going to tell you about in just a short - plus every other security you discover as an ***Outstanding Investments*** member - will no doubt prove valuable, profitable and surprisingly safe. Keep reading...

Fact: In Just a Few Decades, There Will Still Be Only One Economic Superpower in the World - But it *May Not be the U.S.*

You'd have to have been under a rock to not at least be *aware* of the Chinese economic boom that's been growing steadily for the last decade. It's hard to buy anything wearable, watchable or electronic in the United States that doesn't say 'Made in China' on it. And of course, you probably knew that China has enjoyed 'most favored nation' trade status with the United States. since early in the Clinton years...

Here's how China's gotten so powerful so quickly: In just the last decade and a half, China has made itself the "factory to the world." By exploiting its citizenry for cheap labor - the lowest-paid Chinese factory workers routinely put in 14-hour days for around $100 a month in wages - it's become a major producer of goods. Recently, its economy blew past Germany's, and it's estimated to eclipse industrial powerhouse Japan in *just a year or two*.

And within another decade, it may well *overtake the United States* in industrial might.

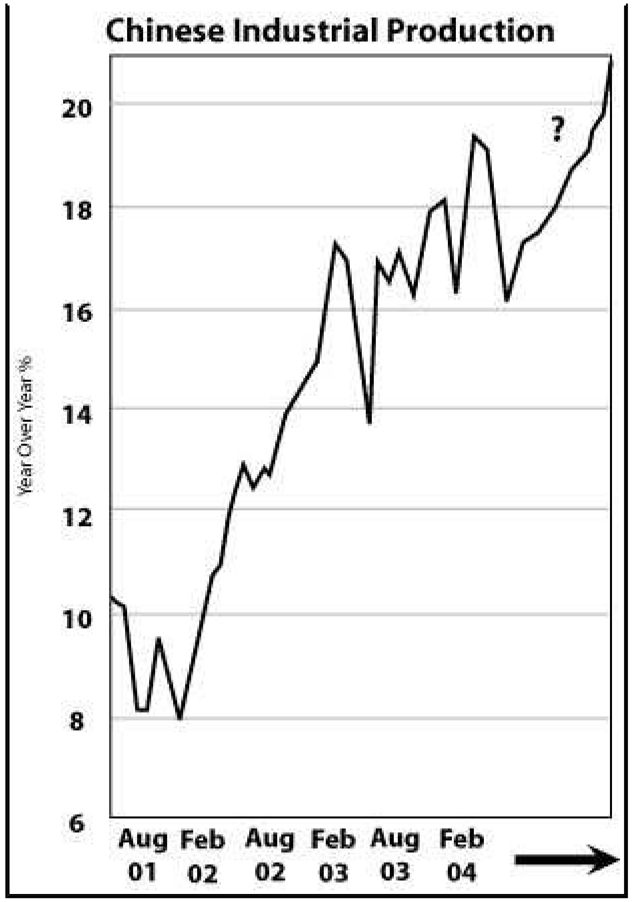
China's economy has grown an *average of more than 8% per year* for the last 10 years (ours grows at around 3-4% - brisk by all but Chinese standards). In 2005, it's expected to grow by *more than 10%*.

This rivals America's rate of economic growth in the fabulous '50s, but on vastly larger scale...

But the sheer volume of Chinese growth and economic expansion is hard to fathom without a slap-in-the-face of sheer facts. To put China's growing manufacturing and export dominance in perspective, consider that the Chinese currently make:

- **More than half of the world's TVs**
- **60% of the world's cell phones**
- **50% the world's shoes (and 95% of those sold in the** United States**)**
- **80% of the toys sold in the** United States
- **Furniture for just about every major American brand**
- **90% of the sporting goods sold in the** United States
- **BMW cars, Intel processors, Dell computers, Boeing jets...**
- **Even 100% of *Levi's blue jeans* are now made in China!**

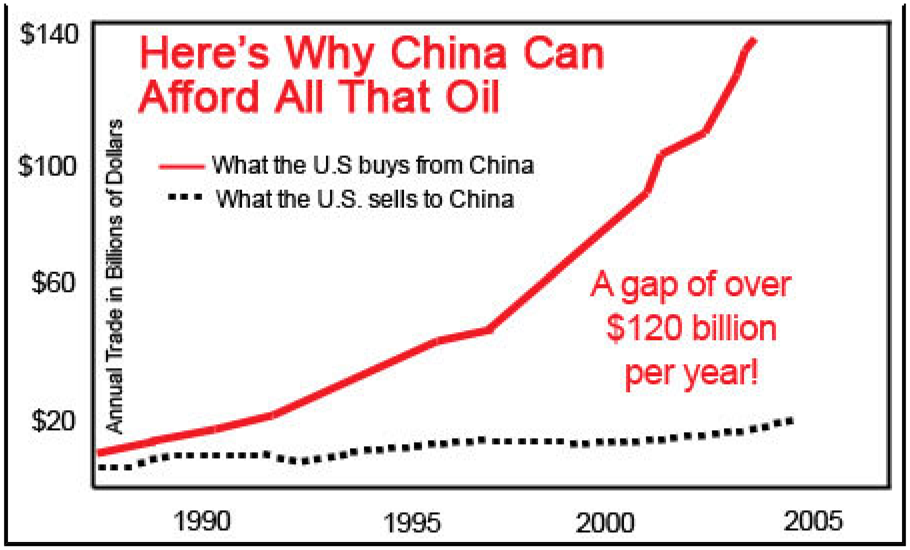
Because of the cheap labor and scantly regulated trade, over 450 U.S. companies have moved their operations to the People's Republic - *10 times as many* as were based there just 15 years ago. Currently, China has *over 300 automobile assembly plants* - and more on the way once pending manufacturing deals with GM, Daimler-Chrysler, and Cadillac take effect...



Perhaps the most telling statistic pointing to China's growing industrial might is this: Currently, our trade deficit with China is around $1.5 billion a day. That's around a *million bucks a minute*...

Yes, you read that right - every minute that passes, we buy a *million dollars more stuff from China than it buys from us*. Mind-boggling, isn't it? It's difficult to even imagine the sheer quantities of oil and other energy this production juggernaut demands. What's even more shocking is this: The awesome growth of this Chinese manufacturing machine is only one of three major reasons why China's demand for oil and other resources has skyrocketed in the last decade - with no end in sight!

It's also *only one dimension* of your ability to profit beyond your wildest dreams on the upcoming China-driven commodities boom, if you let me help you get in right now - the proven, low-risk ***Outstanding Investments*** way. Keep reading...



Explosive Economic Growth Equals Consumption - and Fuels Equally Consumptive Development From Within

As incredible as China's growth in world manufacturing has been (and continues to be), its *internal* growth has been every bit as spectacular. Fueled by the avalanche of profits from goods production, China has poured billions into infrastructure development in the last 15 years. Factories, high-rise office buildings, airports, shopping centers, roads, railways - you name it. China's building it all...

Again, for some perspective: In 1989, China had just 170 miles of paved roads. Since then, it has increased its total highway miles by *over 100 times*, to 18,500 miles. In three years, it will have over 50,000 miles worth of pavement - more than the United States.

Recently, China has begun expanding and electrifying its railways (it already has nearly one-third the track miles that we do), constructing massive irrigation projects, assembling a 4,000-mile crosscountry gas pipeline, building 27 nuclear power plants and undertaking massive construction for the 2008 Beijing Olympics.

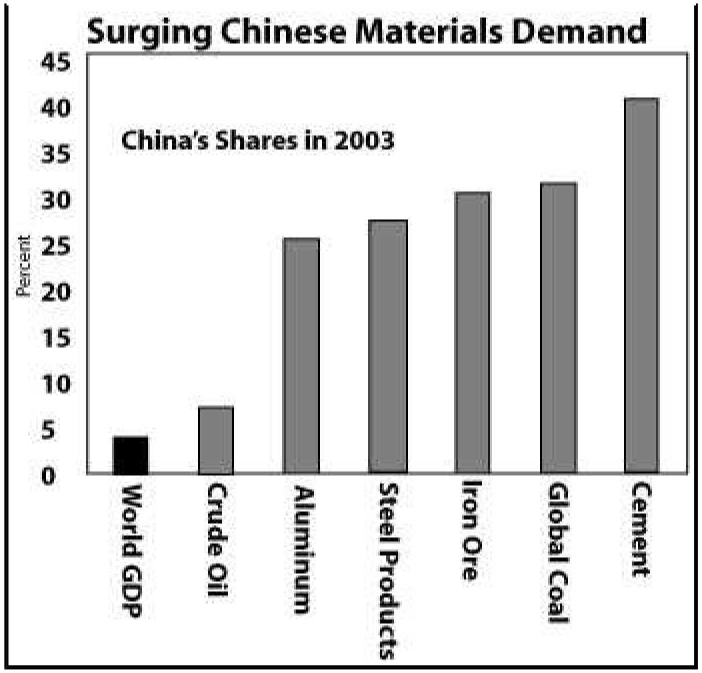
All of these endeavors require oceans of oil, of course - but they also need huge amounts of *just about every other resource and commodity out there*. Case in point: Last year, China consumed or drove demand for a staggering percentage of the raw materials produced on planet Earth. It used:

- **66% of the world's iron ore**
- **40% of the world's steel**
- **30% of the world's coal**
- **20% of the world's copper**
- **19% of the world's aluminum...**
- **And an *unbelievable* 55% of the world's cement!**

That's right: More than half of the construction done with concrete on planet Earth in calendar year 2004 took place in China. And that's in the middle of a *roaring U.S. housing construction boom*...

Such gross consumption can equal grotesque profit - but only for those in the know, like my ***Outstanding Investments*** readers. Join them and you could be one of the savvy few that could make **275%**, even **3,000% or more**, just by being a member of this respected, exclusive advisory. Why, in just the last few years, alert ***Outstanding Investments*** members have cashed in spectacular gains on all kinds of 'raw materials' and 'consumables' type growth-based commodities, including...

- **53% on cement (as of March 4, 2005)**
- **151% on one gold company, and...**
- **270% on silver**



In just a minute, I'm going to show you how you can find out how to make smart, ultra-profitable plays on *all of these commodities and more* (plus oil and gas, of course). It's all waiting for you in a special six-volume ***Orient Express - to Profit*** library I'll show you how to get **FREE** in just a minute.

But before that happens, I want you to understand the *third* aspect of China's development that spurs their snowballing demand for raw materials, foodstuffs, minerals, energy, and *especially oil*...

Rise of the New "Red Army" - of *Consumers*

When folks think of China, they probably first think of *people* (in a few years, they'll think *$5-dollar gas*, but that's a later point). And truly, China's immense advantage in inexpensive production stems from its formidable population density: around 1.3 billion at last estimate - more than four times the United States', in a country that's smaller in actual real estate.

And even though China is still a communist dictatorship, the rapid development and influx of profits from exports and demand for both skilled and semi-skilled workers have created a "middle class" of sorts. And although per-capita incomes are still pitifully low by U.S. standards, the average Chinese household income is growing at a world-record clip, creating a vast class of bona-fide consumers who want - and can now afford (sort of) - things like cars and vacations...

Things that require *petroleum*.

In 1993, there were only 700,000 cars in China (besides the tens of thousands being manufactured there for foreign sale, I mean). Today, there are *7 million*. And with their modern explosion in highway construction, shopping venues and even tourism hotspots, the Chinese will be driving exponentially more with every passing year.

They'll be traveling in other ways, too - especially once their air travel system catches up with their population. Currently, China has only 1/15th the airports of the United States. Imagine what their jet-fuel needs will be once they have as many planes per capita as we do. Even as it is, Chinese travel and tourism is a burgeoning industry.

When you add the growing consumption of this new "red army" to the Chinese government's need for more and more oil to not only cement its status as 'factory to the world' but also to construct new factories, cities, roads, shopping centers, airports and the like for this new middle class to work, live and recreate in, you're talking about not only an *monumental drain on the world's crude supplies*...

But also an unprecedented opportunity to profit in the resource commodities sector, if you invest carefully. Of course, I'm going to tell you exactly how shortly - plus offer you **10 FREE GIFTS** just for learning how to properly ride the coming boom. For the moment, though, I want to bring the focus back to the role *oil* will play in your future investment success - if you can detach yourself from the inevitable political flag-waving spurred by the coming rise of China and invest wisely.

That's exactly what ***Outstanding Investments*** is going to help you to do - starting right now, *today*. Keep reading...
